

A WORRY-FREE VACATION

Cybersecurity guidelines for
staying **safe** while OOO

Use your personal device for personal information

Public computers should be treated like public restrooms: **take special care when using them**

On public devices:

Refrain from accessing personal information.

If no other option exists, open in Incognito or Private mode

Get a mobile data plan

While convenient, public Wi-Fi provides an easy route for hackers to steal passwords and money.

Most secure option: your phone's mobile data.

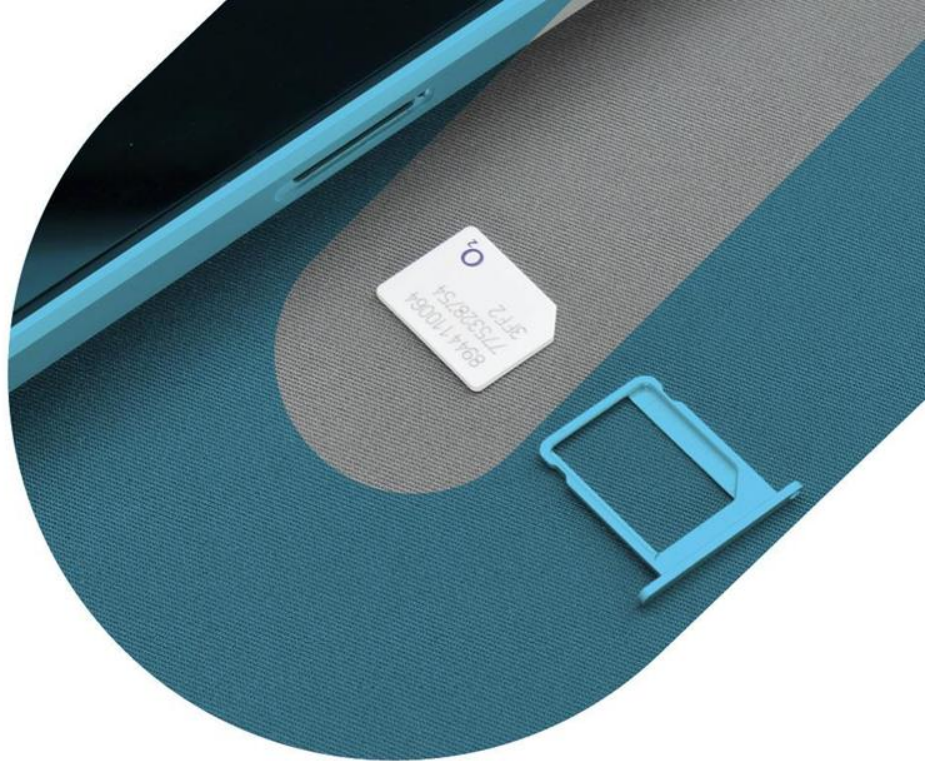

Flying abroad? Consider a local SIM card, as data plans are usually cheaper this way

Using a VPN is also a good option.

if you prefer (and know how) to DIY

Using public Wi-Fi?

- Access financial information using mobile apps
- Access websites by typing their URL *and don't follow any link!
- Got a browser warning of any kind? Stop right there. Your network is probably compromised

Prepare for the worst

Phones get stolen; yours could be next.

Verify your backup is enabled

iCloud for iPhones, Google Photos for Android

Activate a screen lock

This prevents access to your sensitive data

Enable location tracking and remote wipe

"Find My iPhone" (on iPhone) or "Find My Device" (on Android)

Store a paper trail

Keep a printed copy of your
airline tickets, passport,
and other important documents

Traveling with kids?

Prepare an action plan: what to do if someone gets lost

Enable family location monitoring available on iPhone and Android devices

To sum it up

- Use your personal device for personal information
- Get a mobile data plan
- Prepare for possible phone theft
- Keep a paper backup of critical documents
- Prepare a family safety plan (as needed)
